

The Economy and Interest Rates 2017-18

UK. The outcome of the EU referendum in June 2016 resulted in a gloomy outlook and economic forecasts from the Bank of England based around an expectation of a major slowdown in UK GDP growth, particularly during the second half of 2016, which was expected to push back the first increase in Bank Rate for at least three years. Consequently, the Bank responded in August 2016 by cutting Bank Rate by 0.25% to 0.25% and making available over £100bn of cheap financing to the banking sector up to February 2018. Both measures were intended to stimulate growth in the economy. This gloom was overdone as the UK economy turned in a G7 leading growth rate of 1.8% in 2016, (actually joint equal with Germany), and followed it up with another 1.8% in 2017, (although this was a comparatively weak result compared to the US and EZ).

During the calendar year of 2017, there was a major shift in expectations in financial markets in terms of how soon Bank Rate would start on a rising trend. After the UK economy surprised on the upside with strong growth in the second half of 2016, growth in 2017 was disappointingly weak in the first half of the year; quarter 1 came in at +0.3% (+1.7% y/y) and quarter 2 was +0.3% (+1.5% y/y), which meant that growth in the first half of 2017 was the slowest for the first half of any year since 2012. The main reason for this was the sharp increase in inflation caused by the devaluation of sterling after the EU referendum, feeding increases into the cost of imports into the economy. This caused a reduction in consumer disposable income and spending power as inflation exceeded average wage increases. Consequently, the services sector of the economy, accounting for around 75% of GDP, saw weak growth as consumers responded by cutting back on their expenditure. However, growth did pick up in quarter 3 to 0.5% before dipping slightly to 0.4% in quarter 4.

Consequently, market expectations during the autumn rose significantly that the MPC would be heading in the direction of imminently raising Bank Rate. The **MPC meeting of 14 September** provided a shock to the markets with a sharp increase in tone in the minutes where the MPC considerably hardened their wording in terms of needing to raise Bank Rate very soon. The **2 November MPC quarterly Inflation Report meeting** duly delivered on this warning by withdrawing the 0.25% emergency rate cut which had been implemented in August 2016. Market debate then moved on as to whether this would be a one and done move for maybe a year or more by the MPC, or the first of a series of increases in Bank Rate over the next 2-3 years. The MPC minutes from that meeting were viewed as being dovish, i.e. there was now little pressure to raise rates by much over that time period. In particular, the GDP growth forecasts were pessimistically weak while there was little evidence of building pressure on wage increases despite remarkably low unemployment. The MPC forecast that CPI would peak at about 3.1% and chose to look through that breaching of its 2% target as this was a one off result of the devaluation of sterling caused by the result of the EU referendum. The inflation forecast showed that the MPC expected inflation to come down to near the 2% target over the two to three year time horizon. So this all seemed to add up to cooling expectations of much further action to raise Bank Rate over the next two years.

However, GDP growth in the second half of 2017 came in stronger than expected, while in the new year there was evidence that wage increases had started to rise. The **8 February MPC meeting** minutes therefore revealed another sharp hardening in MPC warnings focusing on a reduction in spare capacity in the economy, weak increases in productivity, higher GDP growth forecasts and a shift of their time horizon to focus on the 18 – 24 month period for seeing inflation come down to 2%. (CPI inflation ended the year at 2.7% but was forecast to still be just over 2% within two years.) This resulted in a marked increase in expectations that there would be another Bank Rate increase in May 2018 and a bringing forward of the timing of subsequent increases in Bank Rate. This shift in market expectations resulted in **investment rates** from 3 – 12 months increasing sharply during the spring quarter.

PWLB borrowing rates increased correspondingly to the above developments with the shorter term rates increasing more sharply than longer term rates. In addition, UK gilts have moved in a relatively narrow band this year, (within 25 bps for much of the year), compared to **US treasuries**. During the second half of the year, there was a noticeable trend in treasury yields being on a rising trend with the Fed raising rates by 0.25% in June, December and March, making six increases in all from the floor. The effect of these three increases was greater in shorter terms around 5 year, rather than longer term yields.

As for **equity markets**, the FTSE 100 hit a new peak near to 7,800 in early January before there was a sharp selloff in a number of stages during the spring, replicating similar developments in US equity markets. The major UK landmark event of the year was the inconclusive result of the **general election** on 8 June. However, this had relatively little impact on financial markets. However, **sterling** did suffer a sharp devaluation against most other currencies, although it has recovered about half of that fall since then. Brexit negotiations have been a focus of much attention and concern during the year but so far, there has been little significant hold up to making progress.

The **manufacturing sector** has been the bright spot in the economy, seeing stronger growth, particularly as a result of increased demand for exports. It has helped that growth in the EU, our main trading partner, has improved significantly over the last year. However, the manufacturing sector only accounts for around 11% of GDP so expansion in this sector has a much more muted effect on the average total GDP growth figure for the UK economy as a whole.

EU. Economic growth in the EU, (the UK's biggest trading partner), was lack lustre for several years after the financial crisis despite the ECB eventually cutting its main rate to -0.4% and embarking on a massive programme of quantitative easing to stimulate growth. However, growth eventually picked up in 2016 and subsequently gathered further momentum to produce an overall GDP figure for 2017 of 2.3%. Nevertheless, despite providing this massive monetary stimulus, the ECB is still struggling to get inflation up to its 2% target and in March, inflation was still only 1.4%. It is, therefore, unlikely to start an upswing in rates until possibly towards the end of 2019.

USA. Growth in the American economy was volatile in 2015 and 2016. 2017 followed that path again with quarter 1 at 1.2%, quarter 2 3.1%, quarter 3 3.2% and quarter 4 2.9%. The annual rate of GDP growth for 2017 was 2.3%, up from 1.6% in 2016. Unemployment in the US also fell to the lowest level for 17 years, reaching 4.1% in

October to February, while wage inflation pressures, and inflationary pressures in general, have been building. The Fed has been the first major western central bank to start on an upswing in rates with six increases since the first one in December 2015 to lift the central rate to 1.50 – 1.75% in March 2018. There could be a further two or three increases in 2018 as the Fed faces a challenging situation with GDP growth trending upwards at a time when the recent Trump fiscal stimulus is likely to increase growth further, consequently increasing inflationary pressures in an economy which is already operating at near full capacity. In October 2017, the Fed also became the first major western central bank to make a start on unwinding quantitative easing by phasing in a gradual reduction in reinvesting maturing debt.

Chinese economic growth has been weakening over successive years, despite repeated rounds of central bank stimulus and medium term risks are increasing. Major progress still needs to be made to eliminate excess industrial capacity and the stock of unsold property, and to address the level of non-performing loans in the banking and credit systems.

Japan. GDP growth has been improving to reach an annual figure of 2.1% in quarter 4 of 2017. However, it is still struggling to get inflation up to its target rate of 2% despite huge monetary and fiscal stimulus, although inflation has risen in 2018 to reach 1.5% in February. It is also making little progress on fundamental reform of the economy.
